

input clip a: "seven"
waveform + calibrated noise

input clip b: "three"
waveform + calibrated noise

ridge classifier (the probe)

$$W = (\Phi \Phi^T + \lambda I)^{-1} \Phi^T Y$$

linear & closed-form: separation must
must pre-exist in Φ — the dynamics wrote it

no-dynamics control (the floor)

identical ridge on frontend features
directly, field bypassed;
cell – floor = dynamics' contribution
